Kamil SMÍŠEK

Unknown variety of Silesian groeschl struck under Leopold I in Opole in 1697 There is no complex typological study in rich production of one of the smallest denomination struck in the Silesian government mints. Some older publications tried to describe significant variability of the Silesian groeschls of Leopold I in complexity, but it is still possible to find new and unknown varieties. This mentioned groeschl struck in Opole in 1697 is interesting because of use of atypical ornamental elements on reverse. They have not been detected yet on coins produced Opole in the 1680s and 1690s.
