Abstract. A list of 1,671 specimens of bats belonging to 36 species, seven genera, and five families of the superfamily Rhinolophoidea, housed in the collection of the National Museum, Prague, Czech Republic, is presented in a systematic review.

Key words. National Museum, collection, catalogue, bats, Rhinopomatidae, Rhinolophidae, Hipposideridae, Rhinonycteridae, Megadermatidae.

The collection of mammals housed in the National Museum, Prague (NMP), comprises about forty thousand specimens. With this number of items, it represents the largest and most diversified mammal collection in a public institution of the Czech Republic and ranks among the medium-sized museum collections of mammals in Europe. The collection is composed mostly of small mammals (Eulipotyphla, Rodentia) collected in Central Europe and the Balkans, although it comprises representatives of all mammal groups and most of the families. Majority of the content of the NMP collection of mammals has not yet been presented systematically, several published lists were focused rather randomly on various specialised topics (HERÁŇ 1966, 1988, MAZÁK 1974, HERÁŇ & MAZÁK 1976, ANDĚRA 1987, HERÁŇ et al. 1992, NEUMANNOVÁ 1997, VOLF 2010, ROBOVSKÝ et al. 2015, VOLF & BENDA 2021) or were prepared as guides to permanent exhibitions (HERÁŇ 1968a, b, MAZÁK 1976).

Here, the first part of the systematic catalogue of bats housed in the NMP collection is presented. As systematic and complete lists of the NMP collection of mammals, only the catalogues of cetacean and perissodactylian specimens have been presented so far (ROBOVSKÝ & BENDA 2006, ROBOVSKÝ et al. 2009, 2010, 2014a, b). Various lists of specimens of selected bat taxa housed in the NMP collection are scattered across faunal surveys, reviewing the data on bats of certain geographical scopes, or in the lists of study material used in various morphological,

phylogenetical or parasitological studies. Only few times a list of the bat collection items was published, always limited with regard to a certain geographical focus (GAISLER 1956, ANDĚRA 1987, BENDA et al. 2008, 2011, 2019). A provisional review of bats in the museum collections of former Czechoslovakia was given by GAISLER et al. (1978); however, the situation described by the latter authors has changed significantly since then.

The complete number of bats in the NMP collection well exceeds 10,000 specimens, about a quarter of the whole mammal collection. The presented first part of the NMP catalogue of bats consists of representatives of the superfamily Rhinolophoidea; it contains data on 1,671 specimens of five families and 36 species that were formally included in the collection (i.e., an ID was assigned to them) until the end of August 2021 (Table 1). Altogether 38 type specimens of five taxa of this superfamily, including five name-bearing specimens, are parts of the list (some of them were mentioned already by MLÍKOVSKÝ et al. 2011b).

This taxonomic selection is a result of the *Covid-19 Chiropteran Knowledge Base* project supported by the Synthesys⁺ Virtual Access. As a direct consequence of the preparation of this catalogue and a part of the Synthesys⁺ project, here presented list of specimens has been submitted parallelly to the Global Biodiversity Information Facility (GBIF).

Since the specimens of Rhinolophoid bats originating from Central Europe are mostly not inventoried properly but just several old items (cf. GAISLER 1956), the list of the rhinolophoid specimens (three species) from the Czech Republic and Slovakia will be presented elsewhere, in some of the next volumes of this catalogue series.

The particular species lists of specimens are arranged in a geographic order, according to countries (from west to east and from north to south; from Europe to Asia and to Africa), and within the countries in an alphabetical order (according to the collection locality name) and then, in time order (according to collection date). The lists include, for each item, the following information: (1) indication of sex, (2) collection ID, (3) preparation type (see Abbreviations below), (4) name of the locality (primarily listed by a name of the settlement or notable physical feature; name of the first level administrative division of the respective country where the site lies is added, see Abbreviations below), (5) date of collection, and (6) collector name/s. The currently valid names of localities and the current names of the first level administrative divisions are used in the descriptions of the specimen origin (for geographic coordinates of the localities see Gazetteer below, in alphabetical order). The lists of specimens of particular species are complemented by a list of references reporting the particular specimen/s or the finding/s, i.e. additional data concerning the specimens.

ABBREVIATIONS. Preparation type: A = alcohol specimen; – B = skin (balg); K = skin (carpet); – S = skull; – Sk = skeleton; – W = dry wing. – **Administrative division:** Dep. = Department; – Dist. = District; – Gov. = governorate; – Pref. = prefecture; – Prov. = province; – Reg. = region; – Rep. = Republic.
