Abstract. Type specimens of moth flies (Diptera: Psychodidae) deposited in the Department of Entomology, National Museum, Prague are catalogued. We provide detailed information about the type material of 99 taxa (94 species from subfamily Psychodinae, three species from subfamily Sycoracinae and two species from subfamily Trichomyiinae), including holotypes of 88 species and one neotype. All holotypes and other selected type specimens are photographed. Digital photographs are stored in Morphbank, available online. A hyperlink is provided for every taxon listed when using a digital copy (pdf format) of this catalogue. The year of publication of *Copropsychoda bulbosa* Ježek & Harten, 2006; *Falsologima verrucosa* Ježek & Harten, 2006; *Psychana rujumensis* Ježek & Harten, 2006 and *Psychoda obscuripennis* Ježek & Harten, 2006 is corrected.

Introduction

At the National Museum in Prague, Czech Republic (hereafter NMP; NMPC when referring to collection) the entomological collection currently contains over seven million specimens, including primary types of more than 10,000 taxa. Most of these specimens and types belong to order Coleoptera (beetles), but nearly all other insect orders are represented by an abundant material, including types. Despite the fact that the Diptera collection ranks among the small

to medium parts of the collection regarding its relative number of specimens of the NMPC, it contains many historically important specimens and numerous primary types. Type material of family Psychodidae is catalogued in the present contribution.

Brief history of the Diptera collection in the National Museum in Prague

In 1906 and 1908, the Diptera collection in NMP was initiated when a small part of the collection (18 boxes of identified material) of Ferdinand Kowarz (1838–1914) was acquired. This material, mainly collected in western Bohemia, contains voucher specimens associated with the first checklist of Bohemian Diptera (KOWARZ 1894). In 1925, the collection of Antonín Vimmer (1864–1941) was obtained. This collection comprising 92 boxes contains exclusively material collected in the Czech Lands. Numerous voucher specimens to the Vimmer's checklist of the Czech dipterous insects (VIMMER 1913) are present in this material. Further additions to the Diptera collection were from Alfred Hetschko (1854–1933) including specimens from the Czech Republic and southern Europe (i.e. 24 boxes of identified specimens obtained in 1933). In 1939, two collections were acquired including the collection of Tachinidae from Juraj Čepelák (1917–2000) and part of the collection of Dimitrij Jacentkovskij (1898–1945).

In 1953, Josef Moucha (1930–1972) became the first Diptera curator in the Entomological Department of NMP (HOBERLANDT 1974, KOLEŠKA 1987). He was a well-known specialist in both Lepidoptera and Diptera and a passionate advocate of entomology. His collecting and exchanging activities were extensive and throughout the years he accumulated Diptera material from the Czech and Slovak Republics and neighbouring countries (Austria, Germany, Hungary), southeastern Europe (Albania, Bulgaria and countries of the former Yugoslavia), Georgia and Iran. Josef Moucha was mainly interested in the dipteran families Tabanidae and Asilidae, but also Syrphidae in part. Most numerous part of NMP Diptera collection is that of Tabanidae (MOUCHA & JEŽEK 1972, JEŽEK 1976) started by Josef Moucha and supplemented by his colleagues (especially M. Chvála and J. Ježek). The Tabanidae collection contains more than 50,000 specimens and about 100 type specimens. Josef Moucha published 106 papers on Diptera, 96 papers on Lepidoptera, 37 other articles and 11 book titles (KRAMPL & JEŽEK 2002). In 1971 he became head of the Entomological Department of NMP. Unfortunately, his excellent career came to a premature end in 1972 as the result of a car accident.

Jan Ježek (*1945) was responsible for the NMP Diptera collection during the years 1967–2011. At first he collaborated with Josef Moucha on the development of the dipterological collection and worked primarily on family Tabanidae. Later, however, he began intensively to collect non-biting moth flies (in 1971) and to work on the taxonomy of the family Psychodidae. His first publication on Psychodidae was published six years later (JEŽEK 1977) and he continues to publish actively to date. During the course of 40 years, Jan Ježek accumulated a very large collection of Psychodidae preserved in ethanol and prepared more than 21,000 slides with specimens mounted in Canada balsam. The Psychodidae type material of NMPC consists of 785 specimens, all prepared by Jan Ježek. Detailed information about these specimens is included in the present catalogue.

Since the 1990's, several Diptera collections varying in size were acquired by NMP: coll. Jan Dirlbek (1930–2012) (Tephritidae), coll. Jan Lellák (1926–1993) (Chironomidae), coll. Jiří Olejníček (1946–2005) (Dolichopodidae), coll. Petr Lašovka (1938–2005) (Mycetophilidae, Sciaridae, Drosophilidae and Scatopsidae), coll. Helena Potměšilová-Karnecká (*1947) (Ephydriidae), coll. Milan Chvála (*1936) (Tabanidae), and coll. Jaromír Vaňhara (*1947) (Opetiidae, Platypezidae).

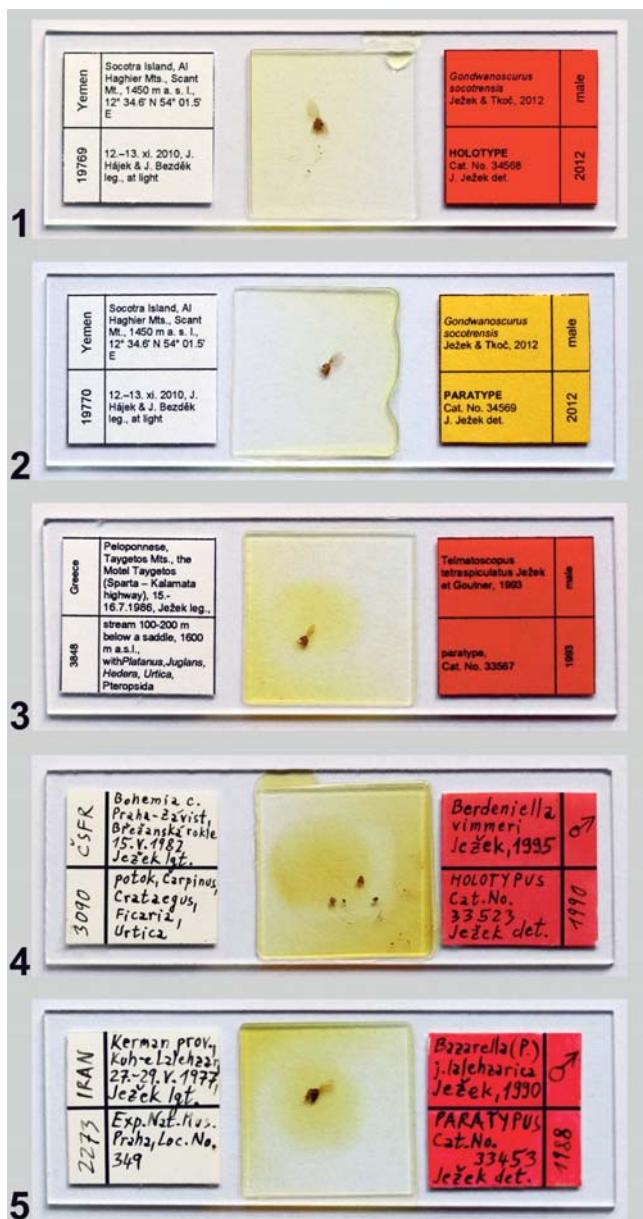

Currently, the Diptera collection is curated (since 2011) by Michal Tkoč (*1985). He cooperates with Jan Ježek on several Psychodidae and Tabanidae projects, but his own research activity lies in the study of the flat-footed flies (Opetiidae and Platypezidae) and other small-scale projects involving families Dolichopodidae and Stratiomyidae.

Material and methods

This catalogue is formatted following the previously published catalogues of Coleoptera, Heteroptera and Polyneoptera types held in NMPC (BEZDÉK & HÁJEK 2009, 2010a,b, 2011, 2012, 2013; HÁJEK & ŠVIHLA 2012; KMENT & KOLÍNOVÁ 2013; MACHÁČKOVÁ & FIKÁČEK 2014). The subfamilial taxa are ordered alphabetically; tribal classification is not used due to its inconsistency among authors (cf. QUATE 1959; VAILLANT 1971–1983; JEŽEK 1983a, 1984b,c, 1990a, 1994c, 2004a; DUCKHOUSE 1987; WAGNER 1990; ESPÍNDOLA et al. 2012; KVIFTE 2012). Each entry includes the name of the taxon in original combination, the complete reference to the original description of the species (including the original combination and spelling of the name, and author, year and page of the description), and the list of type specimens present in the NMPC. Number of specimens and their sex is indicated. All type specimens are mounted in Canada balsam on glass slides. Slides were numbered in the NMPC with two separate series of numbers: Inv. No. = Inventory Slide Number of the family Psychodidae (on the left bottom field on the locality label) and Cat. No. = Catalogue Number of the slide. The catalogue numbers are used for the type material and historical specimens deposited in the NMP Diptera collection.

Exact label data are listed for all specimens, with our remarks placed in square brackets. We use the following abbreviations: [p] – preceding data are printed, [hw] – preceding data are handwritten. Separate labels are indicated by a double slash ‘//’ and lines within each label are separated by a slash ‘/’. Unless otherwise indicated, all labels are white with black ink/printing color. Examples of type slides from the NMPC with their type and locality labels are shown in Figs 1–5. Type and locality labels made during the preparation of this paper were made by M. Pecharová and M. Tkoč and are shown on Figs 1–2 (holotype labels are red, paratype labels are yellow). Labels made by Jan Ježek are both handwritten and printed and are shown on Figs 3–5 (all type labels are red).

All holotypes and other selected type material were photographed using a Nikon Eclipse TS-100F trinocular microscope and final photographs were combined from multiple layers using Helicon Focus Pro 5.2. Images are stored in Morphbank, available online (<http://www.morphbank.net/>). Hyperlinks are provided for every taxon listed when using digital copy (pdf format) of this catalogue.
