### Abstract

Arsenopyrite has been identified in an amphibolite quarry in operation at Libodřice near Kolín (Czech Republic). It forms steel gray fine-grained aggregates, and also as much as 3 mm large rhombic, short prismatic crystals in a tiny quartz veinlet. It is pure arsenopyrite, no other elements apart from Fe, As and S have been found by ED microanalysis.

**Key words:** *arsenopyrite, quartz vein, amphibolite, Libodřice, Czech Republic*
