Likovský, J., Stránská, P., Velemínský, P. (2005): An Assortment of Palaeopathological Findings from the Anthropological Collection of the Institute of Archaeology in Prague in Funds of National Museum. – *Acta Mus. Nat. Pragae, Ser. B, Hist. Nat.* 61 (3–4): 81–140. Praha ISSN 0036-5343.

In 1991, an assortment of palaeopathological findings on human skeletal remains, collected during several decades in the Department of Anthropology, later in the Department of Natural Sciences of the Institute of Archaeology of the Czech Academy of Sciences in Prague was transferred together with the anthropological collections to the Department of Anthropology of the National Museum, Prague. The Department of Anthropology was founded in the Institute of Archaeology in the year 1950. Foundations for the assortment of pathological findings on skeletal remains of past populations were laid by the founder of the department, RNDr. Jaromír Chochol, CSc. (1926–1990) who primarily collected them as material usable in teaching students of prehistory in the Faculty of Philosophy of Charles University in Prague. Among the findings, the most frequent are degenerative, traumatic and inflammatory conditions. However, a series of unique findings is also involved in the assortment, among them the oldest case of tuberculosis in the Czech region dated into the Eneolithic and several findings of primeval trepanations. Also several examples of the so-called pseudopathologies are included in the presented assortment of findings. The palaeopathological diagnoses were newly revised and the findings were provided with new documentation. Individual pathological findings will now be united with residual parts of their skeletons from which they were once taken into the assortment of palaeopathological findings. It must be admitted, that by such arrangement, the assortment of palaeopathological findings will be dispersed but the newly compiled documentation makes it possible to better treat both the material and the palaeopathological findings which thus may be better used as educational, comparative and instructional material.

■ Anthropology, palaeopathology, pseudopathology, intentional interventions, trepanation, tuberculosis.

Received October 10, 2005

Introduction

The assortment of palaeopathological findings on human skeletal remains collected through the 1980s in the Department of Anthropology of the Institute of Archaeology of the Czech Academy of Sciences in Prague was transferred in 1991 to the Department of Anthropology of the National Museum. The findings were not systematically selected for their assortment of pathologies and the paleopathological resources of that time were limited compared to those available today. Despite that, the assortment includes a broad spectrum of pathological states and a number of cases are remarkable – for the proper pathological changes, their extent and for dating the finding with concrete sort of pathology.

Palaeopathological diagnoses were revised and consulted with a number of specialists in clinical medicine, detailed photographic documentation and – if necessary – X-ray pictures of the findings were made.

The aim of the present study is to elucidate the circumstances in which the assortment of palaeopathological findings was formed in the Department of Anthropology of the Institute of Archaeology, to trace the fate of findings and to treat the nature of the completed assortment. The present paper may also serve as a catalogue of findings involved in the assortment, since not all of them were published in the past or incorporated into the survey of known palaeopathological findings (Hanáková and Vyhnanéek 1981).

Department of Anthropology in the Institute of Archaeology and the origin of the assortment

The Department of Anthropology in the former State Institute of Archaeology was founded by RNDr. Jaromír Chochol, CSc. (1926–1990) in January 1950. It was the first workplace specializing in the study of prehistoric and historic human skeletons or burnt residues obtained from archaeological investigations (Blajerová and Šaldová 1986).

The former Department of Anthropology was initially located in the library of the institute, later a space was found in the former hotel "Modrá Hvězda" in Újezd street in Prague. There it stayed until 1964, when it was moved to the seat of the Institute of Archaeology in Letenská Street, the Lesser Town in Prague – in the so-called Krocovský House – into the former horse stable. In this space it resides today as a part of the Department of Natural Sciences, which besides anthropology and paleopathology includes archaeozoology, archaeobotanics and archaeogenetics.

Until the mid 1960s the depositories were located in the already mentioned "Modrá Hvězda" and in "Ungelt" in the Old Town of Prague. The anthropological material was later moved into the space of the former Franciscan Convent at the Holy Trinity Church in Slaný and remained there until the early 1980s. The buildings of former schools in Hněvkovice close to Humpolec and in Obora served as additional depositories. In 1991 the material was transferred from the Department of Anthropology into the collections of the National Museum in Prague. In the early 1990s, the material was moved into subterranean halls beneath the Prague Castle, then into the space of former winter stables of the Czechoslovak State Circuses in Prague – Horní Počernice in whose neighbourhood new modern depositories for the National Museum – Museum of Natural Sciences were built in the late 1990s. The material is currently deposited there.

An impetus to collecting the pathological findings was given in the time when J. Chochol began to read lectures on principles of anthropology to students of prehistory in Faculty of Philosophy of Charles University in Prague. Partially due to the above-mentioned repeated moving of the material basis and to the isolation from the Department of Anthropology, the selection of findings into the assortment of palaeopathological findings has not been systematic. The assortment was assembled in the Department of Anthropology of the Institute of Archaeology mainly by J. Chochol but it involves many findings from burial grounds which were anthropologically treated by other members of the department at that time (M. Blajerová, H. Hanáková, M. Stloukal) and it also involves findings from skeletal collections treated after the death of J. Chochol (P. Stránská, V. Černý); however, all those are derived from older archaeological investigations.

Resources of palaeopathological diagnostics

Palaeopathological changes found in skeletons from prehistoric or historic periods are at the present time treated in a very rich literature ranging from detail monographs to innumerable amounts of descriptions of individual cases (worldwide, more than 26,000 works appeared through the year 1998). This field of study is constantly developing and the diagnostic resources are broader thanks to a continuously richer cooperation with departments of clinical medicine. Consequently, the spectrum of pathological states that may be identified in the skeletal material is also broader. Beside the computer tomography (CT), which has already been

used for years at assorted findings, densitometry was recently added to the group of X-ray examination methods. This clinical method, which is used for diagnostics of osteoporosis, came to be applied in paleopathology for investigating bone mineral density in groups of archaeological skeletons. The aim is to get insight into the trends of development of bone mineral density: it should help to understand the reasons why osteoporosis is progressing among populations in the present time. This problem is currently being studied in several centres, mostly in Europe (Ekenman and al. 1995, Lees and al. 1993, Mays and al. 1998, Mays 1999, Poulsen and al. 2001). Another clinical method, endoscopy, which is used mainly for examination of the digestive tract, came to be used in palaeopathology in 1975, primarily for investigating mummies (first by Manialawi and al. 1978). In our country, endoscopy is used for examination of intracranial structures and anomalies (Likovský and Drda 2003, Velemínský and al. 2005).

Microscopy, which requires much exacting work, is not often used in palaeopathology; however, modern modifications, e.g. scanning electron microscopy and laser scanning confocal microscopy (Šefčáková and al. 2001, Němečková and Strouhal 2003) enhance the accuracy of some diagnoses, mainly at sites of tumour lesions.

The most modern diagnostic branch – molecular genetics – is usable mainly in detecting originators of infectious diseases. Detection of tuberculosis and leprosy is already widespread in the world (in our country Strouhal and al. 2002); the method should be helpful in diagnostics of diseases which do not cause morphological changes in bones and which may be estimated from the circumstances of discovery relating e.g. to pestilence (Guixoule and al. 1994).

With the development of palaeopathological diagnostics it is possible to differentiate the viewpoints from which the study is approached: we speak then about geographic, demographic and historical palaeopathology (Vyháněk 1999). Palaeopathology of populations studies and evaluates the frequency and – if desired – the intensity of chosen pathologic states in dependence on age and sex for all evaluable individuals in a firmly dated group. Palaeopathological casuistic describes in detail findings for only one individual, which is important with regard to circumstances of the archaeological finding.

The majority of the above-mentioned diagnostic methods are currently used in the Department of Natural Sciences of the Institute of Archaeology. A series of studies is being carried out in close cooperation with the Department of Anthropology of the National Museum in Prague. The joint studies use both densitometry and endoscopy thanks to cooperation with several clinical departments. The laboratory of archaeogenetics is part of the Department of Natural Sciences of the Institute of Archaeology, and beside the diagnostic methods that are presently under development (sex determination, genetic relationship) it is beginning to undertake palaeopathological diagnostics. In study of skeletal groups, emphasis is laid on treatment and evaluation with regard to population.

The assortment of palaeopathological findings of the Institute of Archaeology represents a collection of casuistics. In the time of gathering the pathologic findings to form the assortment, resources of palaeopathological diagnostics were rather limited in comparison with the present. Specialized palaeopathological literature, which could serve as a guide for comprehension, and interpretation of pathologic changes in the skeletal material was just beginning to appear. First works conceived in complex and modern style appeared only in the 1960s (e.g. Brothwell 1968); the whole-world Palaeopathological Association was only founded in the year 1973 (Strouhal 1998).

In the past, beside proper morphological estimation of a finding together with macroscopic discernment of abnormalities, the only auxiliary investigative method used was in fact the X-ray examination. Providing X-ray pictures was limited to selected findings; cooperation with clinical departments was minimal at that time.

J. Chochol mostly determined his palaeopathological diagnoses alone, and he also helped other members of the department with this task. Some pathological findings were evaluated by the radiologist prof. MUDr. Luboš Vyhnanánek, DrSc. (1928–1999), who – as one of few clinical physicians – was engaged also in palaeopathology. Unfortunately, due to an immense workload both in his own specialty of radiology and in his post as head of the radio-diagnostic clinic, and with regard to a vast cooperation with perhaps all anthropological investigators, he left behind a number of un-evaluated findings.

Characterization of the assortment of palaeopathological findings

Selection of findings into the assortment of palaeopathological findings was not systematic. Initially, the Department of Anthropology tried to save funds of material originating from older excavations, which were scattered over depositories in various regional museums (Blajerová and Šaldová 1986). This was followed by anthropological treatment of skeletal collections obtained from new excavations (Text-figs 1–3).

Representation of localities and individual periods or cultures is not balanced. The same may be said about the representation of various pathologic states. Sporadically represented is the Eneolithic (the Bell Beaker Culture and the Corded Ware Culture), the Bronze Age (Knovíz Culture and Únětice Culture), La Tène Period and Migration Period. Prevailing represented are Early Medieval findings. Among the localities well represented are those where larger excavations were carried out in the time of collecting the assortment due to treating the material in a direct linkage to the Department of Anthropology of the Institute of Archaeology. For this reason, large parts of the assortment are pathological findings from Lahovičky, Libice nad Cidlinou and Stará Kouřim, together with the Early Medieval findings from Bášť and from Nové Zámky in Slovakia.

The majority of palaeopathological findings are degenerative and traumatic changes, inflammatory changes docu-

mented in a series of illustrative findings and specific infectious diseases like tuberculosis, but the assortment includes also a series of congenital or developmental anomalies and dental defects. Among the intentional intercessions, beside several trepanations are also found amputations of extremities and dental mutilation (see below). Together with clear pathologic states a series of questionable findings was included into the assortment; in several cases the changes are rather post-mortem, some could also be classified as pseudopathologies.

The most important findings

Although the assortment of palaeopathological findings was not formed systematically, it includes a series of findings, which are interesting by proper pathological state, by extent of pathological changes or by dating.

One of the findings remarkable for its dating is the finding of spinal tuberculosis from the Corded Ware Culture from Vikletice (Chomutov district), No. Ao 4790 (Chochol 1970). Nowadays it stands as an example of the oldest evidence for this disease on the territory of Bohemia. Another example of tuberculosis comes from medieval Prague 2-Vyšehrad, No. Ao 8976 (Stránská 1990).

From the other diseases should be mentioned block of vertebrae due to Bechterew's disease, dating from Early Medieval Ages, from Prague Castle, No. Ao 901 (Blajerová 1979). The diffuse idiopathic skeletal hyperostosis (DISH) is represented by two illustrative examples, both dating from Middle Ages: No. Ao 5473 from Bílina (Teplice district) (Hanáková 1971) and No. Ao 6730a from Prague 2-Vyšehrad (Stránská 1990).

A series of finding of osteomyelitis is included in the assortment of palaeopathological findings (Text-fig. 4). Remarkable among them is an undated set of long bones consisting mostly of lower extremities No. Ao 6096 from Prague 1-Na Františku. A rare case is represented by finding of the sclerosing osteomyelitis of Garré from Prague 2-Vyšehrad, No. Ao 9103/XV dating from Middle Ages (Stránská 1990).

Traumatic changes involved in the palaeopathological assortment are numerous. Notable is the fracture of mandible at which a pseudo-arthrosis was formed. The finding No. Ao 1558 dates from the Migration Period and comes from Lužec nad Vltavou (Mělník district). Formation of pseudo-arthrosis is illustrated in a fracture of the forearm with the non-union in the middle of diaphysis of both bones in the forearm, No. Ao 1436, from Late Medieval from the Convent of St. Agnes in Prague 1. Among the changes of traumatic origin, interesting is the finding of knee luxation with a severe deformation of the distal end of the femur and of the proximal end of the tibia, with extensive secondary inflammatory changes. The finding No. Ao 3762 from Žalany (Teplice district) dates from 11th–12th century (Hanáková 1963).

Among the cranial traumata should be mentioned the finding of healed cut wounds and blunt injury of No. Ao 5432, found in the burial ground from Late Medieval up to

Text-fig. 1 Chrudoš Troníček, Jaromír Chochol and Miroslava Blajerová on archaeological excavation in Březno in 1955.

Text-fig. 2 Jaromír Chochol, Miroslava Blajerová and Hana Hanáková at the bus stop near Březno in 1955.

Modern Period at Oškobrh (Oděepsy catastrophe, Nymburk district) (Blajerová 1974), with traces of a healed intracranial hematoma on the internal surface.

To a certain extent the intentional interventions belong to the group of traumatic conditions. The assortment involves three cases of cranial trepanations; all these have already been treated in literature. Two of them date from the Únětice Culture Period. The skull No. Ao 2497 from Blšany (Louny district) (Pleinerová 1960, Chochol 1967a, Malyková 2002, Likovský and Malyková 2004), the skull No. Ao 9493 from Prague 1-Hradčany has a healed trepanation aperture on the vertex (Likovský 2002, Malyková 2002, Likovský and Malyková 2004). The third skull in the assortment dates from the La Tène Period and is remarkable as the second known case of trepanation from this period in the Czech region (Malyková 2002). The finding No. Ao 1595 comes from Praha 7-Bubenč (Chochol 1967) (Text-figs 5–7).

Trepanation rondelles are represented by the findings No. Ao 1459 and Ao 5359 (Text-fig. 8).

Among the intentional interventions in skulls in the assortment may also be seen an infant's skull No. 1530 with an intentional deformation, from Lužec nad Vltavou (Mělník district) dating from the Migration Period (Chochol 1969). Another notable finding is the case of intentional shortening of front teeth in maxilla of the skull No. Ao 777 from "Early Medieval Ages" locality Stará Kouřim (Kolín district), but the finding itself dates from the period of Corded Ware Culture (Chochol 1954c).

Text-fig. 3 Anthropological congress in Mikulov. From the left: Jaromír Chochol, Milan Stloukal and Hana Hanáková, on the right side Miroslava Blajerová.

Due to an inferior state of preservation, the interpretation of finding at the upper limbs of the individual No. Ao 1640b is difficult. This finding comes from Brandýsek (Kladno district) and dates from the 9th to 10th century (Chochol 1957a). Changes observed in all long bones of the upper limbs are probably due to post-inflammatory or maybe even to developmental deformation. The damaged terminals of forearm bones suggest a post-amputation state.

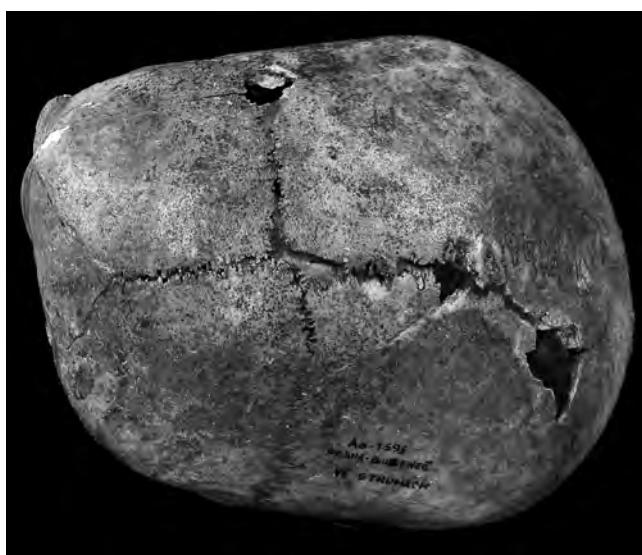

Congenital deviations are represented mainly by anomalies of vertebrae or ribs. Interesting are anomalies observed in long bones of extremities involved in the assortment. The most interesting of those anomalies is the finding of Perthes' disease observed on femur and pelvis in No. Ao 1616 which was found in Brandýsek (Kladno district) and dates from the 9th to 10th century (Chochol 1957a). A shortened and delicate right tibia together with the deformed heel bone observed in the No. Ao 375 from Early Medieval Ages which was excavated in Libice nad Cidlinou (Nymburk district) (Hanáková 1969) most likely suggest a congenital deformation of the pes equinovarus type.

A probable developmental affliction is manifested in the skeleton No. Ao 1110 in region of lower limbs whose long bones are shorter and apparently delicate in comparison with the bones of upper limbs. The finding comes from Libice nad Cidlinou (Nymburk district) and dates from the Early Medieval Ages (Hanáková 1969). No signs of injury are apparent on the preserved spine that could be responsible for the paraplegia and thus it is necessary to consider another cause of paralysis, which led to atrophy of the lower limbs.

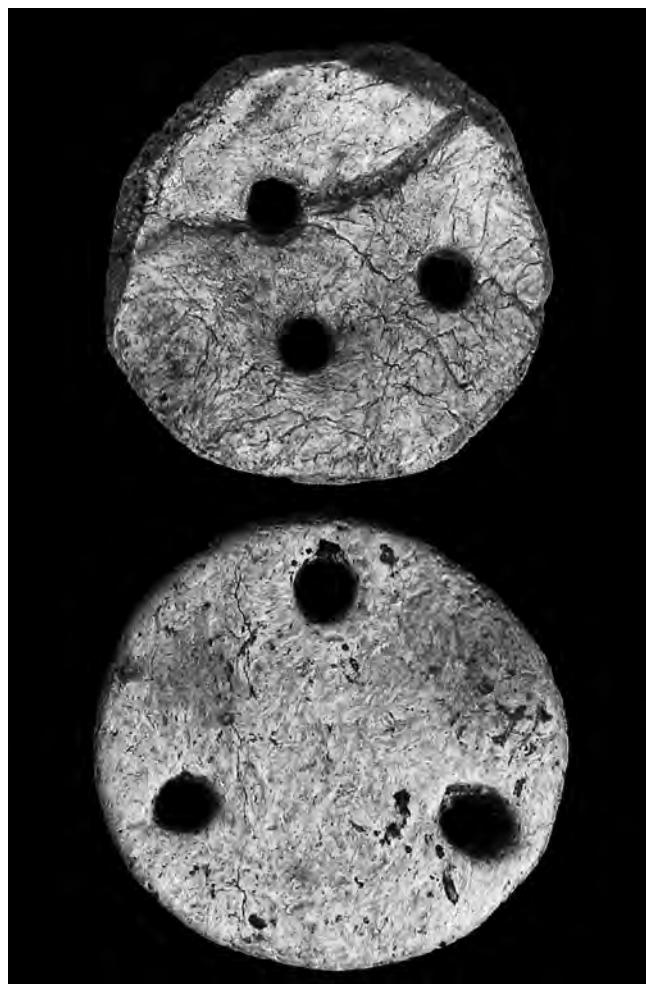

Depressio biparietalis circumscripta is represented by the skull No. Ao 4477 dated from the 8th–9th century, found

Text-fig. 4 One of the illustrative examples of osteomyelitis from assortment of palaeopathological findings: No. Ao 1624 dated to 9th–10th century from Brandýsek.

Text-figs. 5–7. Post-traumatic changes of frontal bone with possible surgical intervention (so-called post-traumatic trepanation) at the skull No. Ao 1595 dated to the La Tène Period from Prague 7-Bubeneč.

Text-fig. 8 Trephination rondelle from the bones of neurocranium No. Ao 1459 and Ao 5359 dated to La Tène Period and to the Late Hallstatt Period from the localities Prosmýky and Tuchoměřice.

in Nové Zámky, Slovakia (Hanáková and Stloukal 1964, Hanáková and Stloukal 1965).

No malignant tumours were found in the assortment of palaeopathological findings. However, numerous benign osteomas are observed in skull No. Ao 4445, which comes from the 8th–9th century and was found in Nové Zámky, Slovakia (Hanáková and Stloukal 1964, Hanáková and Stloukal 1965).

A curious group of bones is represented by a finding consisting of bones and their fragments with apparent signs of cutting, violent breaking, smashing or burning which date from the Knovíz Culture Period. The bones Nos Ao 930–Ao 937 represent the largest series of this type of findings in the assortment from Břešťany (Teplice district) (Chochol 1954b). Interpretation of these findings (Chochol 1971, Chochol 1972, Chochol 1974), which are sometimes considered as an evidence of cannibalism, is still a matter for discussion.

Also, there is a group of findings, which do not represent

real pathologies in the assortment of palaeopathological findings. This group consists both of cases of post-mortem damage of bones and of secondary tingeing of the osseous surface. An example of damage of bone by plant roots is represented by the skull No. Ao 1414 found in Mochov (Prague-east district) from the Migration Period (Chochol 1956c, Chochol 1958); damage of bone by rodents may be seen e.g. on the No. Ao 1903 and No. Ao 2565, both from Prague 5-Lahovičky, which date from the Early Medieval Ages (Chochol and Hanáková 1971, Chochol and Hanáková 1973).

A red to violet tingeing attributed to the presence of bacteria *Serratia marcescens* (former *Bacterium prodigiosum*), producing the pigment prodigiosin and commonly associated with the medieval era (Blajerová 2002) is documented by humerus No. Ao 8927 from Prague 2-Vyšehrad (Stránská 1990, Stránská 1991). A green tingeing caused by copper compounds formed through the contact with bronze objects is distinctly apparent on forearms bones No. Ao 6096 from undated material from Prague 1 – Na Františku, and also on frontal and left parietal bones of the skull from Blešno (Hradec Králové district), without No., perhaps from the Early Medieval Ages. Moreover, on the left temple of this skull are observable organic residues, probably hairs. This also belongs to the pseudopathologies.

Another curiosity is represented by bones of upper limb being enveloped by roots of bush or tree, found in Libice nad Cidlinou (Nymburk district), No. Ao 993, dating from the Early Medieval Ages (Hanáková 1969).

The above selection of findings, which are either unique or best represent concrete types of pathological or pseudopathological changes, by far is not exhaustive. All findings in the assortment of palaeopathological findings of the Institute of Archaeology, including the above-mentioned examples, are presented in the Survey of findings.

Fate of the assortment of palaeopathological findings and prospects for their utilization

Depositories of the Department of Anthropology were repeatedly moved – as already mentioned above. The assortment of palaeopathological findings has until now been deposited separately for reason of the primary function: to serve as a comparative and instructional material. Only now, thanks to new depository space of the Museum of Natural sciences in Horní Počernice, is it possible to restore the fund to its original state, where the paleopathological specimens will be reunited with the remainder of their skeletons.

The basic list of whole palaeopathological assortment was made in the year 1999, then the findings were gradually and systematically photographed again, and the description of pathologies and the assigned diagnoses were revised. Also X-ray documentation was supplied for those findings where it was necessary for determination of the diagnoses. Selected findings were consulted with specialists of various clinical departments.

Pathological findings were once separated from skeletons of respective individuals to form the assortment. Due to

this separation it became more difficult in many cases to determine exactly the diagnoses during the revision, and also the side-by-side comparison and evaluation of pathology in connection with the whole finding was not possible. Partly for this reason the individual pathological findings from the palaeopathological assortment will be reunited with the residual parts of their skeletons.

This return of the palaeopathological findings to the remaining material found in particular burial grounds and localities will lead to a higher value of the anthropological collection – even at a cost of dispersing the assortment of palaeopathological findings which then will not exist as such any longer. However, the presented survey with the photographic documentation permits, even after the return of pathological findings to their own skeletal material, treatment of the surveyed pathologies further in a way that hitherto has not been possible. Only now may the collected findings perfectly serve as an educational, comparative and instructional material.

Acknowledgements

The help of RNDr. Miroslava Blajerová, CSc. and of Mrs. Hana Trnková from the Institute of Archaeology of the Czech Academy of Sciences in Prague, who yielded very important information on the origin of the assortment of palaeopathological findings and on particular findings as well, is gratefully acknowledged.

Selected findings were consulted with specialists in clinical departments whose generous help is also gratefully acknowledged. Our thanks are due to rheumatologist MUDr. Jana Barešová, surgeon MUDr. Jiří Poláček, pediatrician and pediatric surgeon MUDr. Petr Jirásek, orthopaedist MUDr. Jan Dobíáš, dental surgeon MUDr. Vladimír Mondschein and radiologists MUDr. Hana Kacerovská, CSc., MUDr. Jana Leskovská and MUDr. Zdeněk Klán.

For making X-ray pictures are our thanks due to Mrs. Alexandra Dekojová and Mrs. Jitka Kulhanová from the Radio-diagnostic department of the hospital in Říčany. For help in the documentation search and in arrangement of the assortment are our thanks due to Mgr. Drahomíra Malýková, Bc. Tereza Davidová and Mr. Jakub Laušman from the Institute of Archaeology of the Czech Academy of Sciences in Prague.

This research was supported by the projects VZ AV ČR AV0Z80020508 and VZ MK00002327201.

Březno – Ao 1594

Kanín – Ao 6271

Klučov – Ao 280

Kněževes – Ao 772b, Ao 1607

Kouřim – Ao 777, Ao 1946, Ao 1953a, Ao 1954, Ao 1958, Ao 1960, Ao 1971

Libice nad Cidlinou – Ao 121, Ao 124, Ao 128, Ao 138, Ao 164, Ao 166, Ao 183, Ao 186, Ao 188, Ao 254, Ao 255, Ao 263, Ao 266, Ao 375, Ao 451, Ao 454, Ao 565, Ao 567, Ao 572, Ao 574, Ao 576, Ao 596, Ao 993, Ao 997, Ao 1016, Ao 1025, Ao 1076, Ao 1089, Ao 1099, Ao 1102, Ao 1105, Ao 1110, Ao 1111, Ao 1280, Ao 1283, Ao 1303, Ao 1304, Ao 1325, Ao 1328, Ao 1335, Ao 1336

Libušín – Ao 6, Ao 524

Lužec nad Vltavou – Ao 1530, Ao 1558

Mochov – Ao 1411, Ao 1414

Neratovice – Ao 1578

Nové Zámky – Ao 4234, Ao 4262, Ao 4270, Ao 4284, Ao 4292, Ao 4304, Ao 4309, Ao 4319, Ao 4342, Ao 4343, Ao 4347, Ao 4360, Ao 4371, Ao 4399, Ao 4431, Ao 4445, Ao 4469, Ao 4473, Ao 4476, Ao 4477, Ao 4478, Ao 4518, Ao 4525, Ao 4532, Ao 4534, Ao 4545, Ao 4573, Ao 4576, Ao 4587, Ao 4608

Odřepsy – Ao 3507, Ao 5432

Petrohrad – Ao 1748

Přov – Ao 1456

- Praha 1 [Anežský klášter (Convent of St. Agnes)] – Ao 1436, Ao 1437, Ao 1440.
- Praha 1 [Pražský Hrad (Prague Castle)] Ao 368, Ao 892, Ao 894, Ao 901, Ao 903
- Praha 1 (Klárov) – Ao 6238
- Praha 1 (Jelení ulice) – Ao 9493
- Praha 1 (Černínský palác) – Ao 711
- Praha 1 (Na Františku) – Ao 6096
- Praha 2-Vyšehrad – Ao 6716, Ao 6730a, Ao 6730b, Ao 8927, Ao 8934a, Ao 8976, Ao 8978b, Ao 9009a, Ao 9094b, Ao 9095, Ao 9103, Ao 9103/XI, Ao 9103/XV
- Praha 5-Lahovičky – Ao 1224, Ao 1238, Ao 1243, Ao 1500, Ao 1505, Ao 1510, Ao 1512, Ao 1513, Ao 1514, Ao 1700, Ao 1718, Ao 1726a, Ao 1903, Ao 1940, Ao 2324, Ao 2352, Ao 2372, Ao 2392, Ao 2418, Ao 2531, Ao 2544, Ao 2565, Ao 2589, Ao 2703, Ao 2705, Ao 2714, Ao 2724, Ao 2725, Ao 2727, Ao 2739, Ao 2766
- Praha 5-Strahov – Ao 1247, Ao 1249, Ao 1251, Ao 1253, Ao 1254
- Praha 7-Bubeneč – Ao 1595
- Praha 9-Běchovice – without Ao
- Praha 9-Kbely – Ao 1742
- Prosmyky – Ao 1457, Ao 1459
- Radomyšl – Ao 3942
- Sázava – Ao 7918, Ao 7930, Ao 7933, Ao 7948, Ao 7953, Ao 9327, Ao 9329, Ao 9331, Ao 9333, Ao 9335, Ao 9342, Ao 9345, Ao 9364, Ao 9365, Ao 9369, Ao 9370, Ao 9371, Ao 9444, Ao 9449
- Stehelčevěs – without Ao
- Sulejovice – Ao 2114, Ao 2118
- Teplice – Ao 1852, Ao 1853, Ao 1854b, Ao 1857, Ao 1860, Ao 1862, Ao 1942
- Tuchoměřice – Ao 5359
- Velim – Ao 199
- Vikletice – Ao 4790, Ao 5377
- Žalany – Ao 3762, Ao 3766
- ### **Index according to the pathological conditions**
- #### **Skull**
- Developmental anomalies, asymmetry, depresio biparietalis circumscripta, hyperostosis frontalis interna – Ao 3942, Ao 4304, Ao 4477, Ao 9329, Ao 9335
- Cribrum orbitalia – Ao 1510, Ao 1640a
- Degenerative changes of temporomandibular joint – Ao 1247, Ao 1325
- Traumatic changes
- Calvarium – Ao 1253, Ao 1328, Ao 5377, Ao 5432^I, Ao 5432^{II}
 - Splanchnokranium – Ao 1411, Ao 1414, Ao 1614
 - Mandible – Ao 280, Ao 1558
- Trepanation – Ao 1595, Ao 2497, Ao 9493
- Rondelle – Ao 1459, Ao 5359
- Artificial skull deformation – Ao 1530
- Inflammatory changes – Ao 6, Ao 4478, Ao 6096
- Osteoma – Ao 1325, Ao 1857, Ao 4292, Ao 4445
- Maxillary or mandibular torus – Ao 1247, Ao 1251, Ao 1254, Ao 1860
- Developmental anomalies of teeth – Ao 1659, Ao 1854b, Ao 3942, Ao 8099
- Dental caries, intravital loos, inflammatory changes of alveoli – Ao 777, Ao 1253, Ao 1411, Ao 1414, Ao 1607, Ao 3766, Ao 4371, Ao 4445, Ao 4477, Ao 9449
- Teeth mutilation – Ao 777
- #### **Vertebral column and sacrum**
- Anatomical variants, congenital and developmental anomalies
- Vertebrae – Ao 121, Ao 124, Ao 128, Ao 188, Ao 255, Ao 266, Ao 567, Ao 596, Ao 1025, Ao 1089, Ao 1099, Ao 1238, Ao 1283, Ao 1303, Ao 1325, Ao 1336, Ao 1646, Ao 1726a, Ao 1853, Ao 1940, Ao 2497, Ao 2703, Ao 3833, Ao 4342, Ao 4343, Ao 4476, Ao 4518, Ao 4532, Ao 5060, Ao 5465a, Ao 5475, Ao 7953, Ao 8026
- Sacrum – Ao 892, Ao 2724, Ao 4360, Ao 5052, Ao 5060, Ao 6730b
- Degenerative changes
- Vertebrae – Ao 121, Ao 186, Ao 254, Ao 565, Ao 572, Ao 772b, Ao 1076, Ao 1224, Ao 1325, Ao 1512, Ao 1578, Ao 1718, Ao 1862, Ao 2118, Ao 4360, Ao 4477, Ao 5010, Ao 7948, Ao 8000, Ao 8003, Ao 8032, Ao 8042, Ao 8072, Ao 8131, Ao 9331, Ao 9333, Ao 9335, Ao 9365, Ao 9369, Ao 9371, Ao 9474, Ao 9449, not assigned finding
- Sacro-iliac ankylosis – Ao 2324, Ao 4431, Ao 8138
- Compressive fracture of vertebral body – Ao 138, Ao 164, Ao 997, Ao 8131, Ao 9444
- Tuberculosis – Ao 4790, Ao 8976
- DISH (Diffuse idiopathic skeletal hyperostosis, Forestier disease) – Ao 5473, Ao 6730a
- Bechterew's disease – Ao 901
- #### **Thorax**
- Congenital and developmental anomalies
- Ribs – Ao 1614, Ao 4525
- Sternum – Ao 138, Ao 1942
- Traumatic changes
- Ribs – Ao 1960, Ao 2114, Ao 4790, Ao 9370
- Sternum – Ao 1960
- Ossifications
- Ribs – Ao 9345
- #### **Clavicle, scapula and bones of upper extremity**
- Anatomical variants, congenital and developmental anomalies – Ao 188, Ao 1076, Ao 1748, Ao 2739, Ao 5041, Ao 9345
- Degenerative changes
- Shoulder joint – Ao 1280, Ao 2727, Ao 4284, Ao 4304, Ao 4469, Ao 7933, Ao 7998, Ao 9333
 - Elbow joint – Ao 263, Ao 1280, Ao 1640b
 - Phalanges, metacarpals and carpals joints – Ao 183, Ao 254

- Exostosis**
Humerus – Ao 1456, Ao 8011, Ao 9095
- Traumatic changes**
- Clavicle – Ao 121, Ao 188, Ao 894, Ao 1076, Ao 1280, Ao 1325, Ao 1512, Ao 1742, Ao 1953a, Ao 1954, Ao 2352, Ao 4270, Ao 4473, Ao 5455
 - Humerus – Ao 711, Ao 4262, Ao 4576, Ao 5463
 - Radius and ulna – Ao 263, Ao 1243, Ao 1335, Ao 1436, Ao 1860, Ao 2589, Ao 3507, Ao 4234, Ao 4576, Ao 4994, Ao 5463, Ao 8007, Ao 8031, Ao 8113, Ao 9369
 - Phalanges, metacarpals and carpals – Ao 1505, Ao 1958, Ao 2703, Ao 9095
- Amputation – Ao 1640b
- Inflammatory changes**
- Scapula – Ao 9094b
 - Humerus – Ao 4309
- Pelvic bone and bones of lower extremity**
- Anatomical variants, congenital and developmental anomalies – Ao 375, Ao 574, Ao 1110, Ao 1500, Ao 1513, Ao 1616, Ao 1946, Ao 2372, Ao 4534, Ao 4608, Ao 9327
- Degenerative changes
- Hip joint – Ao 1224, Ao 1594, Ao 1954, Ao 4980, Ao 6716, Ao 7918, Ao 9095
 - Knee joint – Ao 1249, Ao 1853, Ao 1862, Ao 1971, Ao 3762, Ao 8072
 - Phalangeal, metatarsal and tarsal joints – Ao 567, Ao 574, Ao 1853, Ao 2565, Ao 5490
 - Osteoma, exostosis
 - Femur – Ao 164, Ao 166, Ao 451, Ao 1148, Ao 5068, Ao 5474, Ao 8978b
- Traumatic changes
- Femur – Ao 368, Ao 454, Ao 1016, Ao 1437, Ao 1960, Ao 2725, Ao 3762, Ao 4996, Ao 5488, Ao 6096, Ao 6238
 - Patella – Ao 2531
 - Tibia and fibula – Ao 254, Ao 903, Ao 1105, Ao 1304, Ao 1325, Ao 1649, Ao 2392, Ao 2418, Ao 2703, Ao 3762, Ao 4270, Ao 4319, Ao 4545, Ao 4959, Ao 6096, Ao 8032, Ao 9103
 - Phalanges, metatarsals and tarsals – Ao 2714, Ao 4347, Ao 4587, Ao 4988
- Amputation – Ao 1148
- Inflammatory changes**
- Hip joint – Ao 1102, Ao 9009a
 - Femur – Ao 1102, Ao 1624, Ao 1700, Ao 2705, Ao 3762, Ao 5432^I, Ao 5432^{II}, Ao 6096, Ao 6271, Ao 8934a, Ao 9009
 - Tibia and fibula – Ao 1247, Ao 1440, Ao 2544, Ao 2705, Ao 2725, Ao 3507, Ao 3762, Ao 4319, Ao 4399, Ao 4573, Ao 5040, Ao 6096, Ao 6716, Ao 8032, Ao 9103/XI, Ao 9103/XV
- Possible postmortal intentional interventions**
- Ao 930, Ao 931, Ao 932, Ao 933, Ao 934, Ao 935, Ao 936, Ao 937, Ao 1111, Ao 1440, Ao 1457, not assigned finding

Explanation to the plates

All photos by J. Likovský.

PLATE 1

- 1.–3. Ao 6 – skull and detail of inflammatory perforation of palatum.
4. Ao 121 – spina bifida posterior (atlas).
- 5.–7. Ao 121 – degenerative changes of lumbar vertebrae.
8. Ao 121 – clavicle fracture.
9. Ao 124 – ponticulus atlantis posterior.
10. Ao 128 – deformation of vertebral bodies (thoracic spine).

PLATE 2

1. Ao 138 – perforatio corpus sterni.
2. Ao 138 – compressive fracture of thoracic vertebra.
3. Ao 164 – exostosis on diaphysis of femur.
- 4., 5. Ao 164 – compressive fracture of thoracic vertebra.
- 6., 7. Ao 166 – osteoma on diaphysis of femur.
- 8., 9. Ao 183 – ankylosis of phalanges, metacarpals and carpal.
10. Ao 254 – bilateral ankylosis of first metacarpophalangeal joint.

PLATE 3

1. Ao 186 – spondyloarthritis of lumbar vertebra.
2. Ao 188 – osteophytes on superior articular process of atlas.
3. Ao 188 – clavicular fracture.
4. Ao 188 – foramen suprascapulare.
5. Ao 199 – pseudopathological changes on skull arising from effects of environment.
- 6., 7. Ao 254 – degenerative changes of second cervical vertebrae and vertebrae C7 and Th1.
8. Ao 254 – degenerative changes of cervical and thoracic vertebrae.
9. Ao 254 – fracture crural bones.

PLATE 4

1. Ao 255 – foramen processus transversi partitum.
2. Ao 255 – spondylolysis of lumbar vertebrae L4-L5.
3. Ao 263 – ankylosis of humerus (olecranon fossa) and ulna (olecranon).
4. Ao 266 – spina bifida posterior (thoracic vertebra).
5. Ao 280 – coronoid process fracture.
6. Ao 368 – femur fracture with inflammatory complications, healed.
- 7.- 9. Ao 375 – developmental defect of right lower limb bones.
10. Ao 451 – exostosis on linea aspera (femur).
11. Ao 454 – traumatic changes of lower femur.
12. Ao 565 – spondylarthritis of lumbar vertebra.

PLATE 5

1. Ao 565 – spondylarthritis of lumbar spine.
2. Ao 567 – spina bifida posterior (atlas).
3. Ao 567 – arthritic changes of first metatarsophalangeal joint.
4. Ao 572 – marginal osteophytes and surface osteophytes on articular facets of C2 and C3.
5. Ao 574 – hip dislocation.
- 6., 7. Ao 574 – degenerative changes of talus with cysts in articular facies.
8. Ao 596 – spina bifida anterior (atlas).
9. Ao 772b – macroporosity and distortion of intervertebral discs of cervical spine (osteochondrosis disci intervertebrales).
- 10., 11. Ao 777 – frontal tooth mutilation with palatal side detail.
12. Ao 777 – inflammatory changes of dental alveolus (lower second molar).
13. Ao 892 – right unilateral sacralization of lumbar vertebra L5.
14. Ao 894 – clavicle fracture, healed.

PLATE 6

- 1., 2. Ao 901 – Bechterew's disease of thoracic spine.
3. Ao 903 – tibia fracture, healed.
- 4., 5. Ao 930 – fragments of skull vault – possible secondary artificial intervention.
6. Ao 931 – fragments of pelvic bones – possible secondary artificial intervention.
- 7.-10. Ao 932 – fragments of skull vault – secondary artificial intervention.
11. Ao 932 – detail of parietal bone bordur.
12. Ao 932 – cut through body of femur.
- 13., 14. Ao 932 – artificial intervention on femoral head.

PLATE 7

1. Ao 933 – signs of burn on humerus.
2. Ao 933 – artificial intervention on body of humerus.
3. Ao 934 – possible artificial intervention on calcaneus.

4. Ao 934 – possible artificial intervention on femur.
5. Ao 934 – signs of burn on tiba.
- 6., 7. Ao 934 – artificial intervention on femur.
8. Ao 934 – artificial intervention on metatarsals.
9. Ao 934 – artificial intervention on fibula.
10. Ao 934 – possible artificial intervention on fragments of infant skull.
11. Ao 935 – possible artificial intervention on calcaneus.
12. Ao 936 – possible artificial intervention on infant talus.
13. Ao 936 – possible artificial intervention on distal epiphysis of infant fibula.
14. Ao 937 – possible artificial intervention on infant fibula.
15. Ao 997 – fused of vertebrae.

PLATE 8

1. Ao 1025 – foramen processus transversarium partitum (C6, C7) and exostosis on transverse process (C7).
2. Ao 1076 – marginal osteophytes and surface osteophytes on articular facets of cervical spine.
3. Ao 1076 – foramen suprascapulare.
4. Ao 1089 – spondylolysis of lumbar vertebra (L5).
5. Ao 1099 – spondylolysis of lumbar vertebra (L5).
6. Ao 1102 – inflammatory changes of hip joint.
7. Ao 1102 – inflammatory changes of trochanters of femur.
8. Ao 1105 – tibia fracture, healed.
9. Ao 1110 – developmental defect of lower limb bones.
10. Ao 1111 – possible artificial breaking up of neocranium.
- 11., 12. Ao 1148 – flat exostosis (femurs).
13. Ao 1148 – possible amputation of lower limb (tibia, fibula).

PLATE 9

1. Ao 1224 – degenerative changes of acetabulum.
2. Ao 1224 – arthritic changes of femoral head.
3. Ao 1238 – spondylolysis.
4. Ao 1243 – forearm fracture, healed.
- 5., 6. Ao 1247 – osteomyelitis of tibia.
7. Ao 1247 – degenerative changes of temporomandibular joint.
- 8.-10. Ao 1249 – arthritis of knee joint – femur (8, 9) and tibia (10).
11. Ao 1251 – mandibular torus.
12. Ao 1253 – cutting injury of parietal bone, healed.
- 13., 14. Ao 1254 – maxillary torus.
- 15., 16. Ao 1280 – degenerative changes of shoulder joint – glenoid cavity (15), head of humerus (16).
17. Ao 1280 – arthritic changes of elbow joint.
18. Ao 1280 – fracture of acromial end of clavicle, healed.

PLATE 10

- 1., 2. Ao 1283 – fused thoracic vertebrae.
3. Ao 1304 – tibia fracture.
4. Ao 1325 – changes in mandibular fossa.
5. Ao 1325 – osteoma on head of mandible.
- 6., 7. Ao 1325 – fused thoracic vertebrae.
8. Ao 1325 – marginal osteophytes and surface osteophytes on articular facets of cervical vertebra.
9. Ao 1325 – clavicle fracture.
10. Ao 1325 – traumatic changes of proximal articular facet of tiba.
11. Ao 1328 – impressive fracture of parietal bone.
12. Ao 1335 – lower radius fracture, healed.
13. Ao 1336 – spondylolysis of lumbar vertebrae L4–L5.
14. Ao 1411 – inflammatory changes of maxillary dental alveoli.
15. Ao 1411 – traumatic changes of zygomatic bone.
16. Ao 1414 – zygomatic bone fracture, healed.

PLATE 11

1. Ao 1414 – upper medial incisor with caries.
2. Ao 1414 – inflammatory changes of dental alveolus (upper first molar) and caries (upper second molar).
- 3., 4. Ao 1436 – forearm fracture, with pseudoarthrosis.
- 5., 6. Ao 1437 – proximal femur fracture with secondary inflammatory changes healed.
7. Ao 1440 – cracks on occipital bone, probably caused by postmortem impact.
8. Ao 1456 – exostosis on middle humerus.
9. Ao 1500 – markedly anteroposterior deflection of femoral bodies (rachitis?).
10. Ao 1505 – fracture of metacarpal and proximal phalanx, healed.
11. Ao 1510 – cribra orbitalia.
12. Ao 1512 – clavicle fracture, healed.
13. Ao 1512 – L4–L5 fused.
- 14., 15. Ao 1513 – bilateral dysplasia of head of femur – hip dislocation right, ankylosis left.

PLATE 12

- 1., 2. Ao 1514 – postmortal changes on body of humerus and ulna (pseudopathology).
- 3.–5. Ao 1530 – artificial skull deformation.
- 6., 7. Ao 1558 – mandibular fracture, healed with pseudoarthrosis.
8. Ao 1578 – parietal foramen.
9. Ao 1578 – degenerative changes of cervical vertebrae.
10. Ao 1594 – arthritic changes on head of femur.
11. Ao 1607 – intravital loss of molars.
12. Ao 1614 – congenital ribs ankylosis.
13. Ao 1614 – traumatic changes of zygomatic bone.
14. Ao 1616 – Perthes' disease (femur).

PLATE 13

1. Ao 1624 – inflammatory changes on articular facets of patella.

2. Ao 1640a – cribra orbitalia.
- 3., 4. Ao 1640b – elbow deformity (trauma?) and possible bilateral forearm amputation.
5. Ao 1646 – fused thoracic vertebrae – incomplete.
6. Ao 1649 – tibia fracture, healed.
7. Ao 1659 – crowding of lower second incisors.
8. Ao 1700 – osteomyelitis in femur.
9. Ao 1718 – spondylarthritis of lumbar vertebra.
- 10., 11. Ao 1726a – fused thoracic vertebrae.
12. Ao 1742 – traumatic changes of acromial end of clavicle and foramen supratochlear.
13. Ao 1748 – fused thoracic vertebrae.
14. Ao 1853 – fused thoracic vertebrae.
15. Ao 1853 – arthritic changes of head of metacarpal.
- 16., 17. Ao 1853 – degenerative changes of knee joint – femur (16) and patella (17).
18. Ao 1854b – retained canine, bilateral (maxilla).

PLATE 14

1. Ao 1857 – osteoma on internal table of frontal bone.
2. Ao 1860 – mandibular torus.
3. Ao 1860 – ulna fracture, healed.
4. Ao 1862 – degenerative changes of intervertebral discs of lumbar vertebrae.
5. Ao 1862 – bilateral arthritis changes on articular facets of patella.
6. Ao 1903 – postmortal changes on body of femur (pseudopathology).
7. Ao 1940 – spondylolysis of lumbar vertebra.
8. Ao 1942 – fenestration of sternum.
9. Ao 1946 – incisura musculi vasti lateralis (patella).
10. Ao 1953a – clavicle fracture, healed.
11. Ao 1954 – clavicle fracture, healed.
12. Ao 1954 – arthritic changes on head of femur.
13. Ao 1958 – traumatic changes of metacarpals.
14. Ao 1960 – traumatic changes of sternum.
15. Ao 1960 – rib fracture, healed.
16. Ao 1960 – traumatic changes of lateral condyle of femur.
- 17., 18. Ao 1971 – arthritic changes of knee joint.

PLATE 15

1. Ao 1971 – ossification of thyroid cartilage.
- 2., 3. Ao 2114 – rib fracture, healed.
4. Ao 2118 – enthesopathy (sternal end of clavicle).
5. Ao 2118 – spondylarthritis of lumbar vertebrae (L1–L4).
6. Ao 2324 – sacro-iliac ankylosis.
7. Ao 2352 – clavicle fracture, healed.
8. Ao 2372 – fossa solei (femur).
9. Ao 2392 – fibrous ossification on lateral malleolus.
10. Ao 2418 – fibula fracture, healed.
11. Ao 2497 – ponticulus atlantis posterior.
12. Ao 2531 – patella fracture, healed.
13. Ao 2544 – osteomyelitis in tibia.
14. Ao 2565 – postmortal changes of bone surface, caused by rodents (pseudopathology).

15. Ao 2565 – traumatic degenerative changes of metatarsals.
16. Ao 2589 – ulna fracture, healed.
17. Ao 2703 – spina bifida posterior (atlas).
- 18., 19. Ao 2703 – lunate asymmetry and traumatic and degenerative changes of phalanx.
20. Ao 2703 – fibula fracture, healed.
21. Ao 2703 – traumatic changes of lower fibula – bilateral.

PLATE 16

- 1.-4. Ao 2497 – healed trepanation (frontal bone and detail of defect).

PLATE 17

- 1., 2. Ao 2705 – periostitis on femur (1) and on tibia (2).
3. Ao 2714 – traumatic changes in middle navicular.
- 4., 5. Ao 2724 – sacralization – dorsal (4) and ventral (5) view.
6. Ao 2725 – proximal femur fracture, healed.
7. Ao 2725 – osteomyelitis of tibia.
- 8., 9. Ao 2727 – degenerative changes of shoulder joint – scapula (8) and humerus (9).
10. Ao 2766 – postmortem changes of forearm (pseudopathology).
11. Ao 3507 – lower radius fracture, healed.
- 12., 13. Ao 3507 – osteomyelitis of lower limb bones.
- 14., 15. Ao 3762 – traumatic knee dislocation with osteomyelitis and degenerative changes.

PLATE 18

- 1., 2. Ao 3762 – degenerative changes on superior articular surface and deformity of tiba.
3. Ao 3766 – inflammatory changes of dental alveoli (molars).
4. Ao 3833 – spina bifida posterior (atlas).
5. Ao 3942 – microdontia – premolar.
6. Ao 4234 – traumatic changes of ulna.
7. Ao 4262 – humerus fracture, healed.
8. Ao 4272 – fracture of acromial end of clavicle.
- 9., 10. Ao 4272 – leg fracture, healed.
11. Ao 4292 – osteoma on frontal bone.
12. Ao 4292 – granular foveolae on internal table of neurocranium.
13. Ao 4304 – asymmetry of mastoid process.
- 14., 15. Ao 4304 – traumatic shoulder dislocation with secondary distortion changes – humerus (14) and scapula (15).
- 16., 17. Ao 4309 – osteomyelitis in humerus – lateral (16) and medial (17) side.
- 18., 19. Ao 4342 – asymmetry of axis.

PLATE 19

- 1., 2. Ao 4343 – facies condylaris bipartita and ponticulus atlantis posterior (right).
- 3., 4. Ao 4347 – traumatic changes of lower limb phalanx.

5. Ao 4360 – degenerative changes and Schmorl's node of thoracic and lumbar spine.
6. Ao 4360 – Schmorl's node in upper vertebral face (thoracic vertebra).
7. Ao 4371 – intravital loss of lower premolar and green tingeing on ramus of mandible (pseudopathology).
8. Ao 4399 – inflammatory changes of proximal end of tiba.
- 9., 10. Ao 4431 – incomplete sacro-iliac ankylosis (right).
- 11., 12. Ao 4445 – osteoma on frontal bone – left.
13. Ao 4445 – osteomas on left temporal bone.
14. Ao 4469 – degenerative changes on head of humerus.
15. Ao 4473 – traumatic changes of acromial end of clavicle (left) – accessory. articular facet (communicated with first rib).
16. Ao 4476 – facies condylaris bipartita (right), aplasia of half posterior arch and exostosis on left transversal process (atlas).
- 17.–20. Ao 4477 – depressio biparietalis circumspecta.
21. Ao 4477 – aplasia (right) and hypoplasia (left) of mandibular head and intravital losses.
22. Ao 4477 – C2-C3 fused.
23. Ao 4477 – degenerative changes of cervical vertebrae.

PLATE 20

1. Ao 4478 – inflammatory changes of mastoid process.
2. Ao 4478 – inflammatory changes of parietal bones.
3. Ao 4478 – granular foveolae on internal table of neurocranium.
4. Ao 4518 – spina bifida posterior (atlas).
5. Ao 4525 – rib bifurcation.
6. Ao 4532 – incompletely fused C2-C3.
7. Ao 4545 – traumatic changes of leg with incomplete bridging.
8. Ao 4573 – osteomyelitis in tiba.
9. Ao 4576 – traumatic changes of upper humerus.
10. Ao 4576 – traumatic changes of distal ulna.
11. Ao 4587 – traumatic changes of proximal metatarsal.
- 12.–14. Ao 4608 – dysplasia of lower limb bones (left) – femur (12,13) and leg (14).
15. Ao 4959 – traumatic changes of articular facet of fibula.
16. Ao 4988 – metatarsal fracture, healed.
17. Ao 4994 – radius fracture, healed.
18. Ao 4996 – lesion near femur epicondyle.
19. Ao 5010 – L4–L5 fused.
20. Ao 5040 – inflammatory changes of femur.
21. Ao 5041 -medial rotation of distal epiphysis of humerus and bilateral foramen supratrochleare.

PLATE 21

- 1.-3. Ao 4790 – tuberculosis of thoracic spine.
4. Ao 5052 – canalis sacralis apertus.
5. Ao 5060 – ponticulus atlantis posterior bilateralis.
6. Ao 5060 – canalis sacralis apertus.
7. Ao 5068 – exostosis on femoral diaphysis.
8. Ao 5432 – healed injury on parietal bone – internal table with possible healed intracranial hematoma.

PLATE 22

- 1., 2. Ao 5432 – healed injury on parietal bone – internal table (1) and external table (2).
- 3., 4. Ao 5432 – healed cutting injury on parietal bone (left) – external table (3) and internal table (4).
5. Ao 5432 – osteomyelitis of proximal femur.
6. Ao 5432 – osteomyelitis (femur).
7. Ao 5455 – clavicle fracture, healed.
- 8., 9. Ao 5463 – humerus fracture (10) and ulna fracture (11), healed.
10. Ao 5465a – spina bifida anterior.
11. Ao 5473 – DISH (thoracic spine).
12. Ao 5473 – exostosis on dorsal surface of upper femur.
13. Ao 5475 – spondylolysis of thoracic vertebra.
14. Ao 5488 – traumatic changes of lower femur.
15. Ao 5490 – degenerative changes of first metatarsal head.
16. Ao 6096 – femur fracture, healed.
17. Ao 6096 – osteomyelitis of femur.
18. Ao 6096 – osteomyelitis of lower limb bones.
19. Ao 6096 – osteomyelitis of femur.

PLATE 23

1. Ao 6096 – osteomyelitis in tiba.
2. Ao 6096 – osteomyelitis in femoral diaphysis.
3. Ao 6096 – inflammatory changes near mastoid process.
4. Ao 6096 – forearm with green tingeing – arising from effects of copper compound.
5. Ao 6238 – traumatic changes of upper femur.
- 6., 7. Ao 6238 – probably postmortem changes of lower femur.
- 8., 9. Ao 6271 – sacrum asymmetry.
- 10., 11. Ao 6716 – reduced medial articular surface (patella).
12. Ao 6716 – inflammatory changes of fibula.
13. Ao 6730a – DISH (thoracic spine).
14. Ao 6730b – sacralization of lumbar vertebra.
- 15.-17. Ao 7918 – degenerative changes of hip joint – acetabulum and detail (15,16) and head of femur (17).

PLATE 24

1. Ao 7930 – marginal osteophytes and surface osteophytes on articular facets of cervical vertebra C6-C7.
2. Ao 7930 – degenerative changes of sternal end of clavicle.

- 3., 4. Ao 7933 – degenerative changes of acromioclavicular joint (acromial facet).
5. Ao 7948 – marginal osteophytes and surface osteophytes on articular facets of lumbar vertebra.
6. Ao 7953 – aplasia of right transversal process (atlasm).
7. Ao 7998 – degenerative changes of shoulder joint.
8. Ao 8000 – marginal osteophytes and surface osteophytes on articular facets of cervical vertebra C2-C5 (left).
9. Ao 8000 – arthritic changes of dens.
10. Ao 8007 – marginal osteophytes and surface osteophytes on articular facets of cervical vertebra (right).
11. Ao 8007 – ulna fracture, healed.
12. Ao 8011 – exostosis on humerus body.
13. Ao 8031 – distal radius fracture, healed.
- 14., 15. Ao 8032 – spondylarthritis of lumbar vertebrae and detail of inferior articular facet.
16. Ao 8032 – periostitis on fibula.

PLATE 25

1. Ao 8042 – degenerative changes of lumbar vertebra.
2. Ao 8042 – enthesopathy (radius).
3. Ao 8064 – periostitis of femur.
4. Ao 8072 – degenerative changes of atlanto-occipital joint.
5. Ao 8072 – fused vertebra C3–C4.
6. Ao 8072 – degenerative changes of cervical vertebra.
7. Ao 8072 – degenerative changes of superior articular surface of tibia (knee joint).
- 8., 9. Ao 8099 – developmental defect – fusion of three teeth – medial and lateral incisors and canine.
10. Ao 8113 – ulna fracture, healed.
- 11., 12. Ao 8131 – compressive fracture of thoracic vertebra.
13. Ao 8138 – sacro-iliac ankylosis.
14. Ao 8927 – purple tingeing of humerus body (pseudopathology).
- 15., 16. Ao 8934 a – inflammatory changes on proximal end of femur.
17. Ao 8976 – tuberculosis of thoracic spine.
18. Ao 9009a – traumatic changes of hip joint.
19. Ao 9095 – exostosis on proximal end of humerus.
20. Ao 9095 – posttraumatic metacarpophalangeal ankylosis.
21. Ao 9103 – tibia fracture, dislocated.
22. Ao 9103-XV – sclerosing osteomyelitis of Garré in tiba.
- 23., 24. Ao 9284 – degenerative changes of cervical spine – C5-C6 (23) and C6-C7 (24).

PLATE 26

- 1.-4. Ao 9284 – degenerative changes of hip joint – head of femur (1,3), acetabulum (2,4).

- 5., 6. Ao 9327 – incisura musculi vasti lateralis.
- 7. Ao 9329 – hyperostosis frontalis interna.
- 8. Ao 9331 – degenerative changes of intervertebral discs (cervical vertebrae).
- 9. Ao 9333 – degenerative changes of intervertebral discs (cervical vertebrae).
- 10., 11. Ao 9333 – arthritis of head of humerus, bilateral.
- 12. Ao 9345 – costoclavicular fossa.
- 13. Ao 9335 – spondylarthritis of thoracic vertebrae.
- 14.–16. Ao 9335 – concavity of skull arising possible from effect of intracranial expansive process and detail of internal table.
- 5. Ao 9369 – radius fracture, healed.
- 6. Ao 9369 – Schmorl's node in lower vertebral face (thoracic vertebra).
- 7. Ao 9369 – enthesopathy (patella).
- 8. Ao 9369 – bridging osteophytes (thoracic vertebrae).
- 9. Ao 9370 – rib fracture.
- 10. Ao 9371 – dislocated vertebral arch (thoracic vertebra).
- 11. Ao 9444 – degenerative changes of thoracic vertebral body.
- 12., 13. Ao 9493 – trepanation, healed.
- 14. Ao 9730 – spondylarthritis, marginal osteophytes and surface osteophytes on articular facets and macroporosity and distortion of intervertebral discs (cervical vertebrae).
- 15.–17. not assigned – possible artificial intervention in lower limb bones.
- 18., 19. not assigned – green body neurocranium arising from effects of copper compound, residues of hair.

PLATE 27

- 1. Ao 9364 – ossification of costal cartilage.
- 2. Ao 9365 – Schmorl's node in upper vertebral face (thoracic vertebra).
- 3. Ao 9369 – bridging osteophytes (lumbar vertebrae).
- 4. Ao 9369 – supplementary articular facet on acromial end of clavicle.

Cover: Skeleton No. Ao 7439 with the probable tuberculous inflammatory changes of carpal bones in the exposition of the Museum of the Capital City of Prague comes from Prague 8-Čimice and is dated to the Únětice Culture; primarily was examined by J. Chochol in 1977.
